

Client Handover Pack

Date: 2026-03-24 Project: Social Study Teammates Repository: COMM2020_Project1_TeamProject

Purpose

This handover pack is the coursework handover documentation for the current submitted prototype. It is intended to help a future client, marker, or developer understand what has been delivered, how to run it, how to test it, and what current limitations remain.

Delivered Handover Documents

This pack contains the documentation expected by the coursework brief:

1. `handover_index.md`: overview of the handover contents
2. `deployment_and_operations.md`: setup, startup, routes, and operating notes
3. `maintenance_and_troubleshooting.md`: maintenance tasks, diagnostics, and troubleshooting
4. `data_management.md`: stored entities, summaries, fixtures, and data considerations

Related Delivered Files

Other relevant delivered files in the repository root are:

- `README.md`: project overview and quick start
- `setup_env.sh`: Codespaces-oriented setup script
- `software_data_inventory_final.xlsx`: software and data inventory deliverable
- `backend/`: Django backend
- `frontend/`: React frontend

System Summary

Social Study Teammates is a learning platform that helps encourage structured discussion. Learners join rooms and participate in activity phases. Facilitators can create and manage activities, monitor rooms, view summaries, and export PDFs. Automated agent rules support discussion quality, participation balance, and evidence use.

Current Implementation Notes

The current shipped application code supports these roles:

- `learner`: temporary account created from the frontend login page

- `facilitator`: temporary account created from the frontend login page
- Django admin/user login: username and password through Django auth pages such as `/accounts/login/` and `/admin/`

Important clarification:

- a "maintainer" is the developers taking over this project
- the current frontend does not have a separate maintainer login page or maintainer route

Scope And Limitations

The handover package describes the code as shipped rather than the intended future state.
